

IMPORTANCE OF ANIMALS

by:
Reysie S. Inieto

Other types of life, as well as animals. It is extremely important in modern society. Animals serve as our friends, personnel, eyes and ears, and nourishment. They can be found in prehistoric cave drawings as well as on agricultural production today. Some of them have been believed to have originated, while others are still wild and are often threatened with extinction by our initiatives. Animal reproduction, like reproductive technologies, seems to be the process by which an organism individuals have become developed by those of the parents. This process should ensure that perhaps a plants and animals species does not have to be extinct. The major purpose of reproduction is to ensure the survival of the species. It also contributes during the systematic review of evolution because sexual reproduction causes variety within a species and helps to increase the species' number of individuals. This mechanism is absolutely essential for sustaining ecological stability and ensuring the survival of life on Earth. Animal performance in livestock is critical for farmers' economic survival, and it consequentially increases the economy of meat and other animal products for consumers. Insufficient fertility is a major problem that restricts output in many animal production systems.

Animals have the ability to reproduce. If organisms cannot do so, the populations will weaken and eventually disappear as people die in ancient times, disease, accidents, predation, and other causes. It could result in widespread hunger and an unbalanced ecosystem the reason for thus occurrence is animals play such an important role in our society and lives. Additionally, wild forests and grasslands would perish because they are adapted to rely on animal decomposers, beneficial insects, and cereal crops. This would result in a sudden decrease in rainfall, as well as earth's atmosphere and climate

disruption. Widespread hunger mixed with a lack of decomposition would result in epidemic sickness.
