

WHY DO YOU LOVE EARTH?

by:

Alvin P. Reyes

Administrative Aide III, SDO Bataan

Climate change are changes in long term averages of daily weather. It is the alteration of global weather conditions brought about by natural and man-made causes.

Climate change not only impact on people's lives but also in animals and plants. Some species of birds lay eggs earlier than expected, animals that are supposedly hibernating are already up, earlier migration of birds, and many more.

There are also numerous effects on human and their livelihood. People who are supposedly wearing jackets or other clothes for cold climate are now wearing their attire for summer. The farmers are supposed to be harvesting but their crops are still not ripe.

It's supposed to be raining but the sun is shining brightly. Many "supposed-to-be" are supposed to happen but it's not. Multiple bad effects of climate change are now occurring like shortage of ice, accelerated sea level rise, longer and more intense heat waves and lastly the Global Warming.

The sun provides the earth with warmth from sunlight. Too much sunlight, however, is harmful and it is our atmosphere that protects us from damage.

In the past years, many tragic events happened in the Philippines because of Climate Change. There are many super typhoons occurred like Typhoon "Yolanda" and recently, the Typhoon "Odette" that swept throughout the country and brought traumatizing memories on people's lives on the areas of Mindanao and Visayas region.

Climate change is the reason behind most animals' extinction and could be the worst man's extinction.

Non-biodegradable materials are being burned instead of being recycled. We didn't conserve water properly. We only let water flow in our faucets when we're taking bath, washing dishes or even when watering our plants. We didn't learn how to lessen the use of electricity.

We can lessen Climate Change by using new power sources and technologies that produces less greenhouse gases. We must adjust our lifestyles and learn to live using less energy. We can plant trees and dispose our waste properly.

But! When would we learn how to do that? What other simple ways can we do to lessen this Climate Change? When will we realize that we are slowly destroying this planet? Do you love yourself? Do you love your country? Why do you love planet Earth?
