

EASY APPROACHES IN TEACHING KINDERGARTEN PUPILS

by:

Christopher A. Tongco

Teacher I, Lalawigan Elementary School

The learners in the kindergarten are in their formative stage and they need a strong foundation in order to face and embrace the coming challenges in the future. In line with aforementioned statement, the teachers have to employ the easy approaches in educating the kindergarten learners.

In order to make the teaching-learning process effective the easy approaches are to be applied by the teachers among their kindergarten learners. They are to be considered for the sake of both teacher and learner. A two-way process yields win-win result and beneficial to the classroom interaction.

The kindergarten teacher may use the process of visualization. The child loves to see different colors, shapes, sceneries and others. Through visualization, the kindergarten teacher may stimulate and realize learning if he or she presents different objects and pictures that are attractive and catchy.

He or she may employ the inquiry-based instruction. At a young age, train the child to be inquisitive. The teacher should stimulate the child's interest to be curious of the various things around him or her and encourage him or her to ask questions and to inquire on different matters. Thus, this approach develops the critical thinking of the learner.

The kindergarten teacher may utilize differentiation. Let the young learners differentiate the things around in the class. Let them tell the differences among the objects presented. This approach teaches the child on the distinction and disparity of things.

He or she may apply technology in the classroom. Hardware and software in technology are very helpful in teaching the learners. Interactive and high technology scenario in the class promote better and easy learning for the kindergarten pupils. The presentation of videos, visuals and other online activities are possible through technology.

The kindergarten teacher may use behavioral management. This is one approach of maintaining discipline in the class so that the discussion of lessons would be organized and orderly. Maintaining good behavior management helps in attaining effective teaching and learning.

He or she may work for the holistic development of the child. The kindergarten does not also teach the fundamentals in education but also develops the child in different aspects namely cognitive, emotional, psycho-social, physical and spiritual. These aspects would constitute the holistic development and growth.

The kindergarten teacher may introduce cooperative learning. This approach is helpful in teaching young learners because you lead them to work with their peers for them to learn by cooperating with others. They share what they know and tend to combine ideas together.

He or she may employ a hands-on approach. This manifests that the teacher guides the learner along the way. The kindergarten teacher always leads the child to proper track or direction in learning.

The kindergarten teacher may use the play method in teaching. This is zestful on the part of each learner because learning may happen while playing in the class. Learning is more effective when the schoolchildren are enjoying.

These approaches are considered easy because they are feasible, possible and accessible. Kindergarten teachers are anticipated to use them in teaching young learners.
