

IMPORTANCE OF FIRST AID SKILLS

by:

Ervin P. Manalang

Teacher I of Pagalanggang NHS

Why does first aid skills have to be taught in school and at home?

Advantages of having basic First Aid Skills or knowledge are the following:

1. It permits those prepared with the possibly life saving capacity to help a harmed or sick individual during an assortment of crisis circumstances.
2. Knowledge in Medical aid helps the actual people whether a crisis influences them straightforwardly or affects individuals they live and work with medical aid can and regularly reduces the seriousness of a crisis in each general setting.
3. While everybody can profit from medical aid information and preparing it is a considerably more prominent advantage to those working or living with people who require continuous exceptional consideration or therapy like kids, people with physical or mental handicaps, people with persistent sick, people with issues like epilepsy, the old, people engaged with sporting exercises, for example, swimming or individuals working in perilous conditions, for example, a processing plant or building site.

At school, first aid skills are taught in various subjects, included in the daily lessons and disaster preparedness drills and exercises. It promotes the sense of safety for teachers and students with good knowledge of the first aid skills are likely to be more alert and active. They are not vulnerable to any accident or injuries might occur. First aid skill promotes the sense of safety in everyone in school. It makes them capable of managing incidents and assessing casualties in time of any disaster comes.

Knowledge in First Aid Skills information benefits an individual's themselves regardless of whether an emergency affects directly or involves people who they live and work with. It gives tools to prevent the situation in becoming worse. In some circumstances, if a patient does not receive basic first aid care immediately their situation will deteriorate or often rapidly. By being able to provide basic care patient can stabilize until emergency medical services arrive.
