

MATH IS LIFE

by:

Ador Salvador Cruz

Master Teacher I, Alternative Learning System

If students would be asked, if there is one subject that they are avoiding the most what would it be, most of them would be saying “Math”. But if we come to realize, math is always a part of our lives so why dislike it?

Even if one enjoys math or one doesn't, numerous abstract and challenging mathematical topics may be one of the reasons why students dislike the subject. All of these concepts, variables, equations, and the dreaded narrative problems can be challenging to decipher and comprehend, but they are necessary for everyone to solve problems in real life, whether now or in the future.

Even during ancient times, math is used even without realizing it. Each and every one of us uses mathematics on a daily basis. Without arithmetic, a crucial part of our world's structure would not be existing.

This language of numbers is used in practically every facet of living. We can identify relationships, comprehend patterns, and make future predictions using mathematics. We apply mathematical ideas and the skills we develop from solving arithmetic problems.

When going to school, riding a bus or walking, counting money and paying for the snack that they would have during recess, the time they spend in every subject, and using a computer all involve numbers in some capacity. Playing the sports that we love definitely includes mathematics as well. It significantly affects how effectively sports are played.

We frequently utilize numbers to describe and learn music since mathematics and music are already related. Understanding fractions and ratios facilitate comprehension of musical note rhythm.

At home, when it comes to helping their parents in doing household chores, for instance in cooking, one must be able to measure out ingredients. Even using a cellphone, which almost everyone has, or any other gadget, a mathematical skill is required. Until they take a step back and look, people are never aware of how much math is all around them.

Whether we realize it or not, we utilize math every day. Math plays a huge role in our daily lives. Whether we like it or not, it is a subject that people will need to know for the rest of their lives. The absence of math would result in complete anarchy. It is worth to say everything around us heavily applies mathematics!

So, why hate math? We live in a world where math exists so let us start loving it. Math is life anyway.
