

IMPLEMENTING LEARNING STRATEGIES AND ACTIVITIES IN THE CLASSROOM

by:

Hilda M. Lazarte

Teacher III, FC Del Rosario Integrated School

Applying varied and up-to-date learning strategies inside the classroom helps students to begin to understand the process of learning. It can also aid the learners to bypass their areas of weakness and to perform at the level at which they are capable. It also promotes flexible thinking and teaches students the importance of shifting their approaches to different task. Some of the effective teaching strategies we can use today are integrating technology in all the subjects that we teach, using graphic organizer to make the lesson easy to understand, serving as a model if ever we teach subjects like Values, encouraging the learners to work as a team, apply the strategy of learning by doing and emphasize behavior management, visualization of information that allows summarization or process information that has been taught in class.

When teachers and mentors study the varied teaching-learning strategies that they will use for the day, goals and lesson objectives will be met, lessons will be clear and easy to understand, there will be collaborative learning, students will be inspired to listen and will be attentive in class, lessons will be well structured and feedbacking will be positive.

Strategies when properly applied, active participation of learners can be observed, and it will improve critical and higher-level thinking skills. Students who always participate in class will increase comprehension through interaction and will become better learners.
