Technology and Livelihood Education (TLE) intends to improve students' abilities in using various forms of technology and the practical application of life skills in order to foster critical thinking, self-reliance, independence, cultural sensitivity, and entrepreneurship in them. This is where students acquire knowledge that are necessary in improving their lives. They will be taught things like home education, sewing, cooking, and many more. Additionally, they will learn here how to use innovation and modern technology to find solutions to issues that may arise in daily life.

Community has been improving for the years passed by. It is caused by the enhanced way of living of people. Most of our activities especially at home were run using high-tech machines and gadgets. Because of how fast people adapt, there are several innovations that led to a much easier life for them. These advancements in our society are made possible through Technology and Livelihood Education (TLE). Technology development helps the community to empower citizens within the larger environment. It allows people to create a better future for themselves (Neelam, 2016).

Technology and Livelihood Education (TLE) is always linked with the innovation of community. TLE addresses issues that people face on a daily basis. Some individuals taught innovation that could prevent it. The pandemic is a phenomenon that has significantly impacted and bothered individuals. Our daily lives are significantly impacted. As a result, some individuals came up with the mask as a product that might avert it. They considered developing the product because they believed it should protect us from the dangerous cause and also be kept up-to-date in the same manner. They sew

other masks with various designs so that people can use and appreciate them using the skills they learned in TLE.

Most importantly, Technology and Livelihood Education (TLE) is integrated with the innovation of community for the reason that the everyday activities and skills of people which they have learned in TLE were innovated already. With a recent invention in cooking, you can now prepare food without lighting a fire. Because there is a lot safer and more environmentally friendly way to catch fish, fisherman no longer need to use explosives when they are fishing. Because of technology, selling is considerably simpler in entrepreneurship.

It can be stated that life is an opportunity as a result of the Technology and Livelihood Education (TLE). It paved the path for all of the beneficial advances that our community has ever seen. The amazing thing about these innovations is that they make the daily lives of people in the community better.
