

## SOME VARIED CONCEPTS OF EDUCATION

by:

**Jeniell G. Reyes**

*Teacher III, Pantalan Luma Elementary School*

According to Jean Piaget, the main purpose of education is to produce creative individuals, ingenious, and discoverers, and individuals who can do new things instead of just imitating what the previous generation has done. In accordance with the theory, Jean Piaget claimed that the fundamental purpose of education is to give students new learning skills and concepts. Every individual has unique abilities and ways of perceiving the world. And through education, a person can explore and learn more about the world in their own unique ways. Thus, we must advance our teaching level to the next stage or higher chapter to help our learners meet the challenges ahead of them.

Moreover, as per John Dewey, education is life itself, not just a means of preparing for it. This indicates that learning is a dynamic process that should take place to improve one's quality of life and awareness. This is founded on the concept that what is delivered to children in the classroom must be associated to the issues and situations that the students encounter in their everyday life.

Nevertheless, the goal of education, according to Robert M. Hutchins, is to equip children to continue their education throughout their lives. Education is a constant process, people learn new things both at school and directly from own experiences. That being said, schools should provide everything students need because education aims to educate and set them up for success. In reality, the only thing schooling can do for learners is to get them ready as promptly as possible so they can overcome whatever problems they may face. Additionally, education prepares individuals for their entire lives. Completing education in school does not indicate that learners have already

finished learning because education is the pursuit of knowledge that never ends. It means that this is just the start of another chapter and experience of everyone's lives.
