

“TEACHLIVE”: A NEW WAY OF TEACHER’S INSTRUCTIONAL METHODS

by:

Fermin D. Herrera

Teacher II, Mariveles National High School – Sitio Mabuhay

Students greatly benefit from teachers' methods of instruction in order to learn. It will help them better comprehend what the lesson is all about. As an educator we should give 100 percent of our unadulterated learned guidance to them. They will benefit from the instruction or discussion if it is constructive.

In addition, as the K-12 education system is implemented in the Philippines, it will be more difficult for teachers to consider, modify, or develop novel approaches to improving the teaching method. Furthermore, Cruz (2010) said that "the execution of the K-12 arrangement in the Philippine Fundamental Training Educational plan is the way into our country's turn of events. However, the public authority deals with numerous issues as it carries out the program throughout quite a long while, it is an essential improvement since expanding the nature of our schooling is basic to our country's prosperity."

In the meantime, in Houston Free School Locale, they foster another courses to assist them with having an upgrade program called "TeachLive" an experimental run program wherein flesh educators convey real examples to virtual understudies in a PC reproduced homeroom. Because the students are programmed to respond to the teacher's actions in real time, teachers can quickly find ways to improve their lessons. Monisha King, a teacher at Kashmere High School, said, "The TeachLive gave me insight into how I actually ask questions." We can ask questions all day, but it's how you ask them that gets students thinking and encourages them to look into their own responses.

According to Sergio Lira (2014), "This is a great idea! Rather than having someone observe, coach, and write a few things on an improvement instrument, this opportunity to involve new or struggling teachers in a direct, interactive manner is significantly more effective. Using the teacher's full body experience of listening, seeing, touching, and thinking to enhance instruction is made possible by this. This is a concept that has been long overdue, given all of the technology at our disposal and the brilliant minds we have access to.
