

IMPACT OF TECHNOLOGICAL RESOURCES

by:

Maria Lourdes A. Sunga

Teacher III Culis Elementary School

Nowadays, technology is the fastest and easiest way of gaining knowledge as we go forward to new ways of living. Evidently, it has contributed a lot to the development and progress of the country's economy and helps mankind live life in a more convenient and luxurious fashion and style.

In line with education, the technological inclination of the system makes it globally competitive and caters educational needs towards its goal of developing lifelong learners and being able to contribute meaningfully to building the nation, as it is stated in the DepEd mission and vision.

However, possibility occurs and still has some risks in the use of technology that the learners may encounter. It is one of the primary concerns that both parents and educators take into consideration and must be vigilant in the technological activities of the child. Since lots of mobile applications are available on the internet that are proven to be burdens and destructive to a child's learning. For instance, their too much exposure to online games and Facebook or social media platforms affects their acquisition of knowledge and psychosocial development that triggers their behavior.

In view of this matter, correct selection, application development as well as choosing the necessary teaching and learning resources that are available and ready to use from several websites will help benefit the learners through proper implementation and direction in the teaching and learning processes. Introducing among the learners the available learning materials from the right learning resources will be of big help in

guiding them in the acquisition of useful knowledge and behavior which help them become rightful and productive citizens.

However, as a teacher, it is important to be vigilant of the author's intention and general character of the material which merely touches or affects the learners' behavior and insights that contribute to their everyday lives. Since what they learn is what they get and act in their surroundings.

In general, careful planning and selection of learning resources are very necessary for the teaching and learning process because they affect the total development of the learners. In determining which technology to utilize, proper evaluation of different applications and tools is a very important stage. The selection of the materials and their integration process into learning will become easier for teachers if the information is made available.
