

ARTIFICIAL INTELLIGENCE: HOW PREPARED ARE WE?

by:

Ryan T. Ambrocio

Teacher I, Luakan National High School

How prepared are we in this artificial intelligence and how may these affect us in terms of what we can actually do in our current education?

In terms of the teaching mode, we have as of the moment after the pandemic, we had opened characteristics of the online teaching and how these can be delivered through online as well as making the deliverables online and this includes different schemata of learning and teaching with different online tools.

With this thing on hand, we as the teachers are quite sure that whatever it is in terms of the online teaching and learning, the main deal is that artificial intelligence is the next score to hit. These scores on the artificial intelligence comes with agreeing the purpose of the AI and how these may be defined through education.

What is artificial intelligence and how these may include in the current set up of education and how artificial intelligence may become a part of the schemata we have as of the moment.

Initially what is artificial intelligence?

Artificial Intelligence amplify the human activities with the current data which are based on online capacities and computer-based development activities. Not that it is focused on the health effects but also on the purpose of education where it can offer more than just the activities of online.

In teaching there are some positive ways on how to enhance the development of online tools and artificial intelligence, but challenges come in in accepting the artificial intelligence and the development of the internet connectivity amidst the current set up of the country all over the department of education.

These are the main things which must be seen on the preparation of educators in the artificial intelligence.

Initially, accept the artificial intelligence as part of the new trends in education now.

Secondly, take part on the definition and purpose of the artificial intelligence.

Third, be aware that artificial intelligence offers not just the delivery of the online activities but offers more.

Fourth, it enhances the delivery of teaching and learning.

Likewise, the artificial intelligence educators must be very much aware of how they can achieve quite the logic of the matter.

Educators must see that development of the artificial intelligence amidst the education.

With this, it is every educator's duty to become cautious with all the appropriate things which can impart knowledge especially for their students.
