SOLO TAXONOMY: A HELP FOR LEARNING PROCESS

by:
John Carlo C. Tello
Teacher III, Mariveles National High School- Poblacion

John Biggs, an educational psychologist and Kevin Collis, an educational linguist, are responsible for the development of a framework known as the Solo Taxonomy. It is designed to aid educators in better appreciating the intricacies of learning outcomes and in establishing teaching and evaluation approaches that are more effective. When it comes to the process of establishing learning objectives, curriculums, and evaluation systems, it is widely adopted since it provides structure. The abbreviation "solo" stands for "Structure of Observed Learning Outcomes," and it refers to a system that gives a mechanism to describe and quantify the degrees of comprehension and information acquisition in students.

By employing the SOLO Taxonomy as a mental framework, educators can structure their thinking in a way that allows for more effective learning outcomes and evaluations. Educators are able to make use of the Solo Taxonomy in order to construct lesson plans and syllabi that bring students from more fundamental to more advanced levels of knowledge in a step-by-step manner. In this way, it is ensured that the learning goals are commensurate with the requisite level of cognitive complexity. When creating tests, teachers can make use of Solo Taxonomy to generate questions and assignments that are in line with the expected level of student comprehension by employing the taxonomy's categories and subcategories. It provides assistance in the development of a variety of assessment types that may be modified to cater to the requirements of students who are at different stages of the learning process. Educators can utilize the taxonomy to give students targeted feedback based on the students' current level of knowledge, which will help students go from one stage to the next. This will allow educators to use the

taxonomy effectively. Educators are able to better tailor their methods of instruction to match the specific requirements of individual students and to provide appropriate assistance for children working at varied levels of conceptualization. This allows for a more personalized learning experience for all students. Give the students instructions on how to use the Solo Taxonomy to conduct a self-evaluation of their current level of comprehension. The learners will be better able to assume responsibility for their own learning and metacognition will be encouraged as a result.

In addition, the SOLO Taxonomy is an excellent tool to use in educational environments since it supports teachers as well as students in comprehending the process of learning as well as the specific skills and information that are required to go from one level of understanding to another. This makes the SOLO Taxonomy a terrific tool for use in educational settings. Because of this, the SOLO Taxonomy is an effective tool for use in educational environments. It's possible that as a result of this, the teaching and learning that takes place will become more effective.
