

ON TEACHING RESEARCH: REVERBERATIONS TO STUDENTS

by:

Aljon F. Tobongbanua

Teacher III, Morong National High School- JHS

Without any uncertainty and a shadow of a doubt, the integration of Research in the curriculum is encapsulated in an important motivating factor that holds enormous significance, particularly for the learners that will benefit from it. Although a few studies aim to unearth revolutionary knowledge on its own merits, the curriculum lays the foundation for students who have access to the course of study. The importance of research cannot be overstated because it is essential to success in educational institutions as well as numerous professional fields including law, language, and finances. The primary goals of research are to provide guidance on action, collect testimony for hypotheses, and contribute to the advancement of expertise in a specific area of study.

Conducting research provides learners and non-professionals who enjoy educating themselves with understanding of the world in addition to attributes that will assist them thrive and enhance their quality of life (Zarah, 2023). On top of that, research is a tool for understanding shortcomings, raising the public's consciousness, disproving deception, and believing facts. One of the most significant impacts of learning research in a sophisticated manner for Junior High School students is that they will develop these abilities and insights at an early age in their lives as students, which will be advantageous in the future when they come across far more intricate and high-standard forms of research studies.

The influence of research is of the utmost significance when carrying out one given that the aim of the researchers is to produce such a ripple effect that will function as a catalyst for individuals to take action on a specific issue or the discrepancy that the

research seeks to address. According to the University of York (2022), research impact occurs when knowledge gained from research contributes to and impacts culture, society at large, the natural environment, and the country's financial system. Nonetheless, on occasions, a specific research study falls short to provide upsides, and at times, research itself fails to convey advantages, particularly for the learners who conduct it. Students frequently struggle to find current subject matter for the studies they are conducting given that they lack comprehension of studies related to the area of interest and are unaccustomed with scientific publications.
