TECHNOLOGY MAKES TEACHING-LEARNING PROCESS EASY

by:
Sherrie Shane S. Peñaflor
Teacher II, Dinalupihan Elementary School

Technology has become vital in the fast life today. It is a technology that has sped up our lives; it is the technology that made our world a smaller place to live in, and it is technology that helped individuals in the school's teaching-learning process. As technology sways in the digital world, it is used to benefit learners of all ages in the learning process.

Technology in education has evolved from merely placing laptops in the four corners of classrooms to providing full pledge tools and resources into the grasp of all children. Technology was a big help to motivate learners. The use of computer-based instruction makes learners feel in control of what they learn. Technology helps to improve learners writing and learning skills. The use of computers and gadgets in the classroom has helped many learners learn how to write well and compose sentences and paragraphs. Computers and other gadgets have word-processing applications that learners use to take notes in the classrooms, these word-processing applications have built-in dictionaries which help learners auto-correct errors and also correct their grammar in a sentence.

Technology helps teachers to collaborate with their students. The use of advanced communication technologies in education helps teachers reach their learners easily in real time and vice versa. Teachers can use cell phones, and the Facebook/messenger app helps to communicate with their learners and parents about their upcoming activities and other matters. This flexibility in interaction and communication makes learners improve their grades.

23 January 2024

But despite technology's help, let us not forget that this technology can only serve and be used as a secondary tool in all aspects of life including the teaching-learning process. It is the teacher who will determine what technology to use to reap the supreme benefits that come along with technology.
