

EMBRACING THE INEVITABLE: AI'S INTEGRATION INTO OUR DAILY LIVES

by:

Arjay A. Alarcon

Teacher III, Justice Emilio Angeles Gancayco Memorial High School

At some time in the past, I can still recall that looking for an answer to my homework from school would have to be hard. I walked hundreds of meters away under the scorching heat of the sun and already felt my feet aching just to go to the public library. Computers and the internet are already present during those times but not readily accessible to all.

In this present era, we are all witnessing the advancement in the field of science and technology making things seem to be all possible. I felt a little jealous because students nowadays will not have to experience the hardships of getting a verifiable answer to the assignments left to us by our teachers. It makes it easier and faster for them to get the answer just by the tip of their fingers. I'm happy at the same time because it does not just impact the students but also a lot of people from different walks of life which technology makes our work more at ease and faster, which we all witnessed through the years.

With these rampant developments, artificial intelligence is well-known these days, which already existed before but now it is becoming famous. Artificial Intelligence or AI outweighs the traditional technology that we already know, and it is very promising. This will enter the early thoughts that we might be replaced by robots or automation which I think is becoming a reality now.

Having these things in mind that people might be replaced by a programmed human-bot, can you imagine that you are in a grocery store and a store helper, and a

cashier will be a robot or will be automated? I guess all of us will have different reactions, some will be amazed, and some will feel weird because it is not what we used to see. In the same scenario, what If artificial intelligence will be put in schools as well? Pupils will be greeted and taught by a programmed teacher and all the schoolwork will be automated with its goal and vision which is to deliver high-quality education with artificial intelligence. It can be rewarding not just for parents but for society since the children will be reaping the benefits of advanced and amazing technology and contributing it to the world later on.

In conclusion, all of us would think that not all good can be good, because no matter how flawless its features are there will still be a loophole. So, before this robot can be integrated with us, human beings, it must be well-established by passing laws and creating implementing rules and regulations and most importantly it must not erase the human social interaction, which we always do and makes us called humans.
