

## UNINHABITABLE HABITAT

*by:*

**Elvira B. Sawi**

*Master Teacher I, San Ramon Elementary School*

A warmth that's not safe for us. A warmth that won't make Earth safe. The Earth we call home.

The greenhouse effect, something that occurs when the gasses trapped in greenhouses are released into the atmosphere. One of the many causes of global warming and climate change are these gasses. A very powerful heat we have caused is brought upon us like, a mighty beast in sky. We were blessed with the land we stand upon giving us what we need. Eventually we got greedy, taking all, we can get without giving anything back.

We've caused so much harm, to the environment, to the planet to ourselves even, the things we do are so extreme that we caused changes that haven't been seen since extinction events. In the span of ten years our deeds have caused a great impact. It's gotten so bad to the point the Earth may be uninhabitable sooner and might reach the point of being irreversible or no return.

This scenario heeds for an immediate action. "Just like what Petteri Talaas, a secretary- General, of the World Meteorological Organization (WMO) stated." Time is running out... The continuing rise in concentration of heat-trap gases including the record acceleration in methane levels, shows we are heading in the wrong direction.

In today's rapidly changing world, educating learners about global warming is more vital than ever. Integrating global warming education into the school curriculum is not just an academic necessity; it is an urgent responsibility. Through education, we can

build a generation of environmentally conscious, informed, and empowered individuals who understand the critical nature of climate change and are prepared to take action. By teaching learners about global warming today, we are giving them the tools to create a better, more sustainable world for tomorrow.

Many believe that this is a “curse”. But I believe it’s a blessing in disguise. One that will help us to not be greedy or selfish and to give back to others rather than hoarding. One that will teach how to properly care lead for our stuff. It’ll help us learn that even the smallest mistake could lead to a life-or-death situation.

A warmth that’s not safe for us. A warmth that won’t make Earth safe. The Earth we call home. If we don’t learn how to take care of it, we may not be able to feel at home on Earth.
