

## DIGITAL TRANSFORMATION IN EDUCATION

*by:*

**Lee Franz Bare Torrecampo**  
*Teacher II, Mandama Elementary School*

The world has changed enormously. The people and the ways they run things altered but they did everything for progress. Notably, in the field of education, digitalization is now being embraced fully.

Currently, the field of education is now on its journey of digitalization, in pursuit of excellence and progress.

As a sign of digital transformation, technology is now being employed to improve the enrollment system which is made possible by LIS. It is now adopting new methodologies for teaching as well as in learning, and it is presently using computers and internet in education offices.

Through digital transformation, a smooth enrollment transpires in schools. The information coming from parents and learners is encoded and transmitted. Each student has an LRN number that identifies a specific learner. Moreover, the number of enrollments in each school may easily be tracked through digital technology.

There is the presence of an engaging and interactive teaching-learning process. Both the teacher and student enjoy the experiences in school due to digital and modern system, method, devices, and materials. The class is indeed full of fun and energy because of the aid of technology.

Through digital transformation better learning outcomes may be achieved. The students tend to grasp quickly what is being taught to them. With the support of

technology, knowledge, skills or competencies are easily transferred to them which make them well-oriented and well-equipped.

The digital transformation sets a flexible and relevant curriculum for students. This connotes that the ones involved in curriculum making include timely and applicable lessons which are not only responsive to the needs of society but are also blended with technology.

There are huge improvements in the administration students' assessments due to digital transformation. A system like LMS, otherwise known as Learning Management System, may be helpful in the provision of tests to be given to learners.

Digital technologies were developed in order to connect people and address the needs of people in the society like those in schools. Digital innovation has shown the capacity to reconstruct, augment and finally transform education. It may also improve the relevance and quality of teaching and learning.
