

STUDENT-CENTERED LEARNING: EMPOWERING LEARNERS FOR CRITICAL THINKING, COLLABORATION, AND LIFELONG SUCCESS

by:

John Michael Y. Conejos

Teacher I, Samal North Elementary School

Learner-centered learning is a new way of teaching that focuses on the student. This way of doing things is not like the usual ones that give the teacher the lead. Instead, it creates a lively and interesting space where students can work together, take charge of their own learning, and get involved with the subject. This article talks about the good and bad things that can happen when you use student-centered learning in the classroom. It talks about how this method helps students become critical thinkers, gives them more motivation, and prepares them for success in a world that is changing quickly.

Student-centered learning also gets students to be active and involved by shifting the focus from lessons led by the teacher to lessons led by the students. This model makes it easier for students to ask questions, share their ideas, and learn more about things that interest them. Students learn how to use what they know in real life, think critically, and solve problems. This prepares them for the difficulties they will encounter in school and in their jobs.

In a student-centered classroom, working together is a big part of learning. When students do group projects, talk about things, and learn from each other, they can work together better. Students learn more when they work together and share their ideas. They also get better at communicating, working as a team, and solving problems.

When students have a say in how they learn, they are also more motivated and take charge of their education. Students can set goals, make choices, and learn about things that interest them when they learn in a student-centered way. People feel more

responsible and accountable when they feel like they have control, which makes them more motivated and more likely to enjoy learning. Student-centered learning prepares students for a future in which adaptability and continuous learning are essential. This method teaches students how to deal with a world that is changing quickly. For example, it teaches them how to learn on their own, read and understand information, and solve problems. Students learn for life and are ready to do well in a world that is always changing and coming up with new ideas.

Also, student-centered learning is more likely to help students remember and use what they've learned because it is interactive and tailored to their needs. When students are actively involved in the learning process, making connections between ideas, and putting what they've learned into practice, they are more likely to remember it and use it in new situations. This deep understanding is more than just remembering facts; it makes it possible for you to learn for the rest of your life.

Student-centered learning is a new way of teaching that puts students in charge of their own learning. This method lets students take charge of their own education by encouraging them to get involved, follow their own learning paths, think critically, work together, be more motivated, feel like they own their learning, and get ready for lifelong learning. When teachers use student-centered learning, they help shape well-rounded people who are ready to do well in the complicated world of the 21st century.
